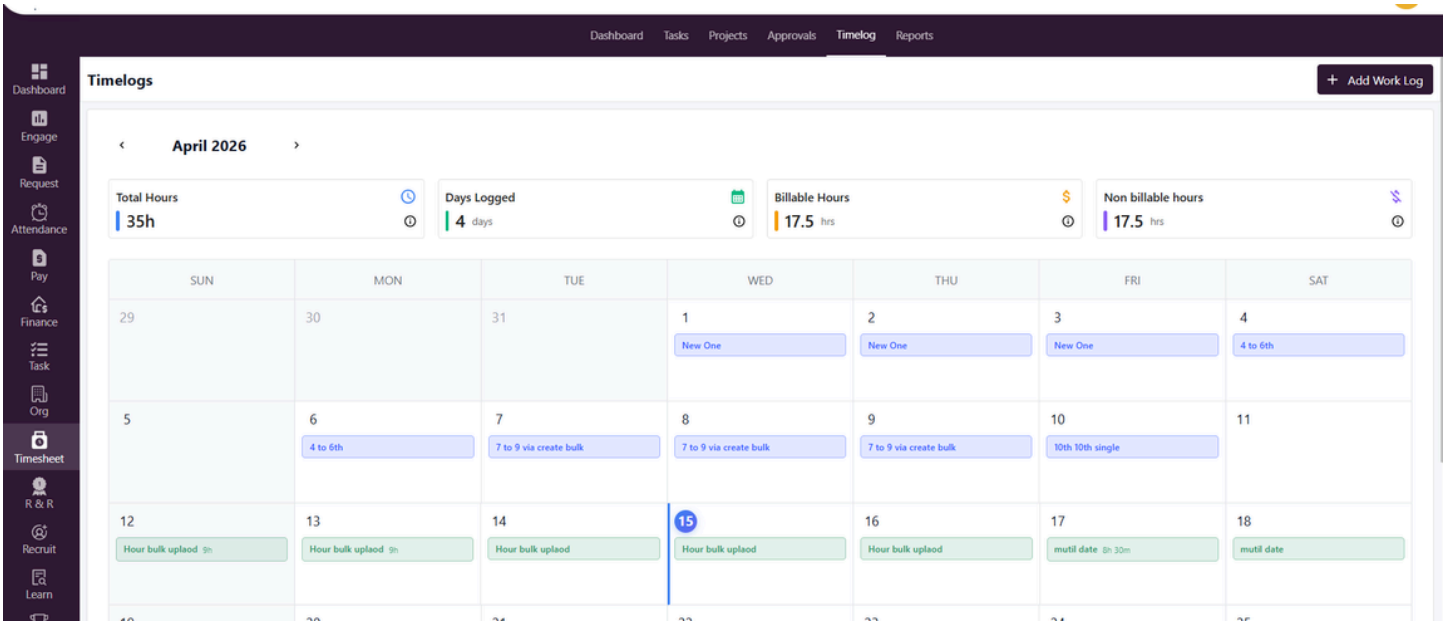
ESS Timesheet Module - New Changes

Module: ESS Timesheet
Feature: Timelog (New Menu)
Version: [V1]
Release Date: [April-1]

1. Overview

A new **Timelog** menu has been introduced under the ESS Timesheet module. This feature provides a calendar-based view that syncs with the employee's actual shift schedule, enabling users to fill worklogs directly from the calendar interface.



2. What's New

2.1 Timelog Calendar View

The Timelog screen displays a **calendar view** synchronized with the employee's assigned shift:

Shift Configuration	Calendar Behavior
Saturday-Sunday as Week Off	Displays "Week Off" - no jobs visible
Saturday as Working Day	Shows Saturday as working with assigned jobs
Custom Week Off Configuration	Reflects actual week off days from shift

Key Point: Assigned jobs are only visible on working days as per the employee's shift configuration.

2.2 Assigned Jobs on Calendar

Jobs assigned to an employee under a project are now directly visible on the calendar:

- If a job is assigned from **21st to 30th March**, the job name appears on all dates from 21st to 30th
- Jobs appear only on working days (not on week-off days)
- Multiple jobs can be visible on the same date if assigned

2.3 One-Click Timelog Entry

Users can now fill timelogs with minimal steps:

Previous Flow:

Navigate to Tasks → Find Job → Select Date → Fill Timelog → Save

New Flow:

Timelog Calendar → Click on Job Name (on any date) → Fill Start/End Time → Save

2.4 Add Worklog (Combined Screen)

A new **"Add Worklog"** button is available at the top-right corner of the Timelog screen.

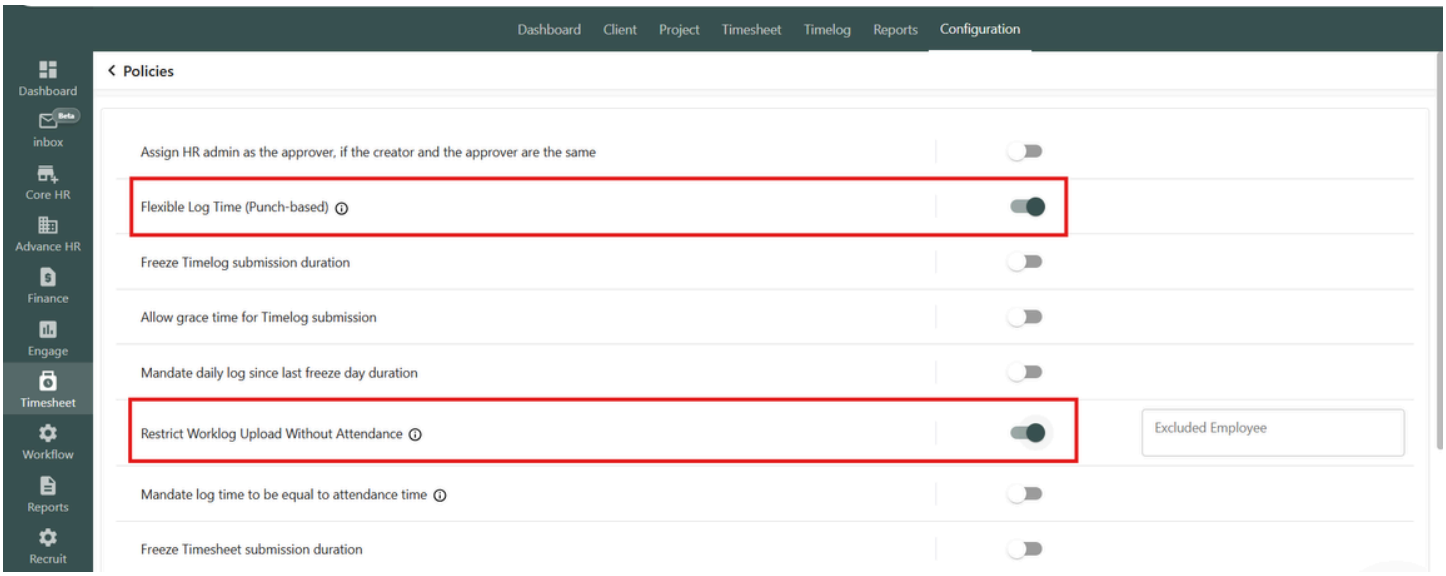
This opens a combined screen with two tabs:

Tab	Purpose
Worklog	Fill timelog for existing assigned jobs
Create Job	Create a new job directly

Benefit: Users can create a job and fill worklog from the same screen without navigating elsewhere.

3. Settings Configuration

Path: Timesheet Module → Configuration → Timesheet Policy → Manage



3.1 Key Settings

Setting	Description
Flexible Log Time (Punch-based)	When ON, validates worklog against actual punch times instead of shift
Restrict Worklog Upload Without Attendance	When ON, requires attendance record to fill worklog

Configuration	Shift Timing	Roster Timing	Timelog Validation
Regular Shift Only	9:00 AM – 6:00 PM	N/A	9:00 AM – 6:00 PM
Roster Activated	9:00 AM – 6:00 PM	6:00 AM – 2:00 PM	**6:00 AM – 2:00 PM**
Roster Activated	9:00 AM – 6:00 PM	10:00 PM – 6:00 AM	**10:00 PM – 6:00 AM**

4. Timelog Entry Window Rules

Settings Combinations, Behavior Logic & Roster Priority

Overview

The Timelog Entry Window determines **when an employee is allowed to save a timelog entry**. This is controlled by two settings:

- **FPL – Flexible Punch Log**
- **RWA – Restrict Worklog Without Attendance**

Additionally, if an employee has a **Roster/Shift assigned for the day**, that roster takes the highest priority in deciding the allowed timelog window.

Settings Combinations & Behavior

Combination 1: RWA = OFF, FPL = OFF (or any OFF state on RWA)

What happens:

- The system uses the employee's **assigned shift window** as the allowed timelog window.
- Timelog is allowed only within the assigned shift start to shift end time.
- If the timelog time falls outside the shift window → **blocked with error:** *"You can fill log within your assigned shift."*

Use case: Standard shift-based orgs where employees must log time only within their fixed shift hours.

Combination 2: RWA = ON, FPL = OFF

What happens:

- RWA is active, so the system **checks attendance first** — is there at least one punch event today?
- If **no punch found** → timelog entry is **blocked** with error: *"No punch-in found for today."*
- If **punch found** → but FPL is OFF, so flexible punch behavior does NOT apply.
- The system falls back to the **assigned shift window** (shift start to shift end) as the allowed timelog window.
- Timelog is validated against the fixed shift window, not the actual punch times.

Use case: Orgs that want to ensure employees have marked attendance before logging work, but still want to restrict logs to the fixed shift window.

Combination 3: RWA = ON, FPL = ON (Full Flexible Mode)

What happens:

- Both settings are active — this is the only combination where **Flexible Punch Log behavior fully applies**.
- The system checks for at least one punch event today.
- If **no punch found** → timelog entry is **blocked** with error: *"No punch-in found for today."*

- If **punch found** → the allowed timelog window is set to: **Actual punch-in time → Actual punch-out time.**
- Employee can log time freely within their actual attendance window.
- If timelog time is within this window → **allowed to save.**
- If timelog time is outside this window → **blocked** with error: *"You can fill log within your assigned shift."*

Use case: Flexible/remote teams where employees work dynamic hours and timelog windows should reflect their actual check-in and check-out times.

Combination 4: RWA = OFF, FPL = ON

What happens:

- FPL is ON but RWA is OFF.
- Per system requirement: **Flexible Punch Log behavior is used ONLY when BOTH FPL and RWA are ON.**
- Since RWA is OFF, the FPL setting is effectively ignored.
- The system applies the **fixed assigned shift window** as the timelog window.

Key Note: FPL alone does not activate flexible behavior. It requires RWA to be ON as well.

Summary Table

RWA	FPL	Attendance Check?	Timelog Window Applied
OFF	OFF	No	Fixed Assigned Shift Window
OFF	ON	No	Fixed Assigned Shift Window (FPL ignored)
ON	OFF	Yes	Fixed Assigned Shift Window
ON	ON	Yes	Actual Punch-In → Actual Punch-Out (Flexible)

Roster / Shift Assignment – Priority Rule

Rule: If an employee has a Roster assigned for the day, the Roster Shift takes the highest priority.

When a roster shift is assigned to an employee for a specific date, the timelog window is determined by that roster shift — **regardless of the FPL/RWA settings combination.**

How it works:

1. The system first checks: *Does this employee have a Roster Shift assigned for today?*
2. **If YES** → The Roster Shift start and end time is used as the allowed timelog window. FPL flexible punch behavior is overridden.
3. **If NO** → The system proceeds to evaluate the FPL + RWA settings as described above.

Example:

- Employee has a Roster Shift assigned: 10:00 AM – 7:00 PM
- Employee actual punch-in: 9:30 AM, punch-out: 8:00 PM
- Even if RWA + FPL are both ON, the allowed timelog window will be **10:00 AM – 7:00 PM** (roster shift), not the actual punch times.

Why this matters: Roster assignments represent a planned, contractual shift for the employee. The timelog system respects this planning layer above dynamic attendance-based flexibility.

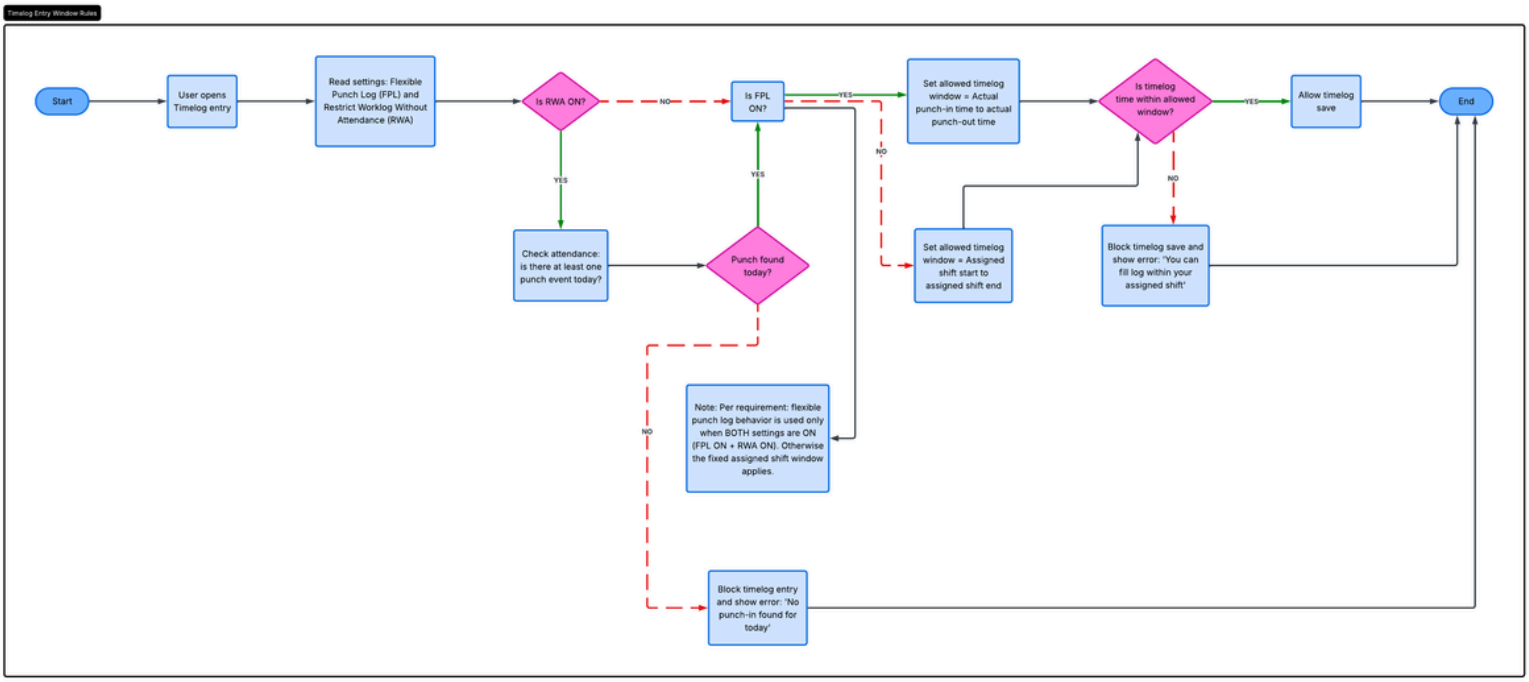
Error Messages Reference

Scenario	Error Shown to Employee
No punch-in found (RWA ON)	*"No punch-in found for today"*
Timelog outside allowed window	*"You can fill log within your assigned shift"*

Key Business Rule to Remember

Flexible Punch Log (FPL) behavior activates **only when both RWA = ON and FPL = ON**. In all other cases, the fixed assigned shift window applies. If a Roster Shift is assigned for the day, it overrides all other window calculations and takes the highest priority.

DFD (Data Flow Diagram):



ESS Timesheet Module – Project Sub-Menu Enhancement:

Feature Documentation | UI & Functional Scope

1. Background & Context

Under the **Employee Self-Service (ESS) portal**, the Timesheet module contains a sub-menu called **"Project."** This sub-menu existed previously but has been enhanced as part of the current release.

The scope of this enhancement is:

- **UI-level changes** for a better user experience and visual feel
- **Functional enhancements** to the Project sub-menu — giving employees better visibility into their assigned projects, team members, and associated timesheets

No backend logic changes are in scope for this release. All updates are on the presentation and navigation layer.

2. Project Sub-Menu – Landing View

When an employee clicks on the **Project** sub-menu under ESS → Timesheet, they land on the **Project List screen.**

What the employee sees:

- A list of all projects **assigned to them** or **tagged against their profile**

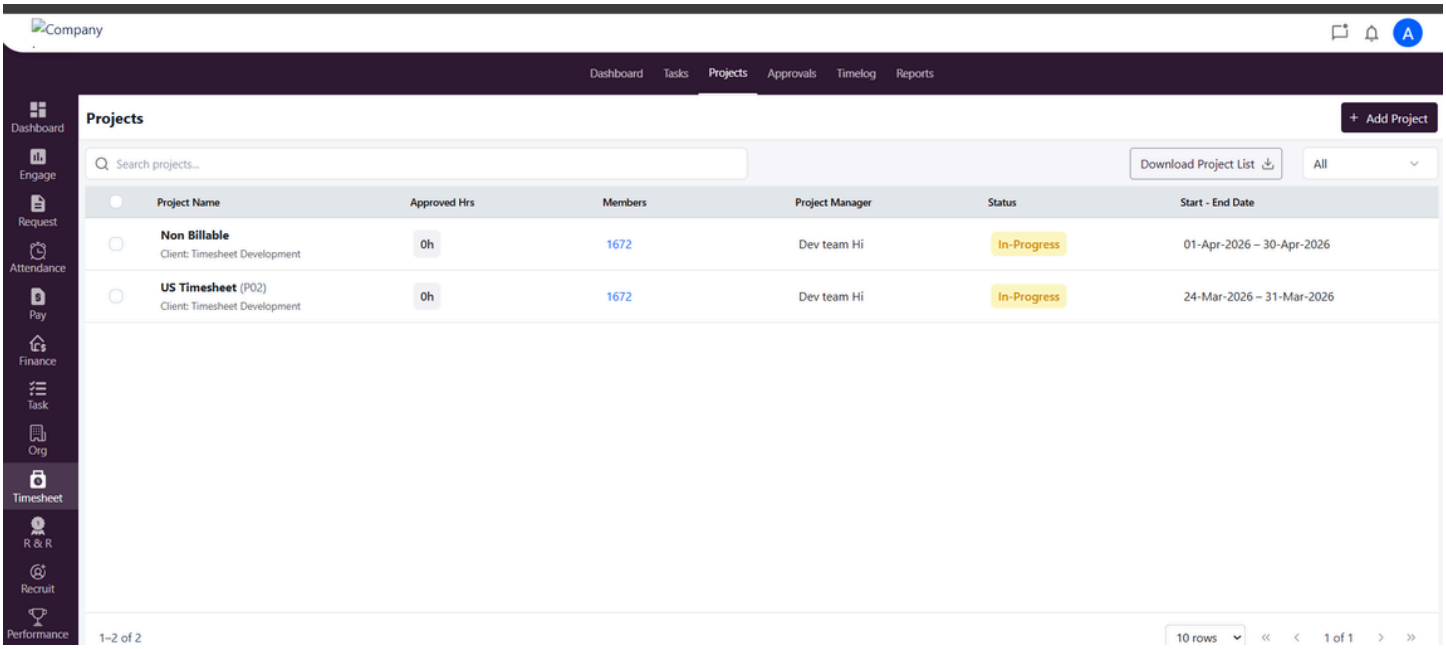
- Each project is displayed as a clickable row/card

Behavior:

- Only projects relevant to the logged-in employee are visible — no other projects are shown
- The UI has been refreshed for a cleaner, more intuitive look and feel

3. Individual Project View – Three-Tab Structure

When an employee clicks on any **individual project name** from the list, the project opens in a detailed view with **three tabs:**



Tab 1 – Details

Displays complete information about the selected project.

Information shown (indicative):

- Project name and description
- Project start date and end date
- Project status (Active / Completed / On Hold)
- Any other project-level metadata configured by the admin

Purpose: Gives the employee a full picture of the project they are part of — scope, timelines, and current status.

Tab 2 – Team

Displays the list of team members assigned to the same project.

What the employee sees:

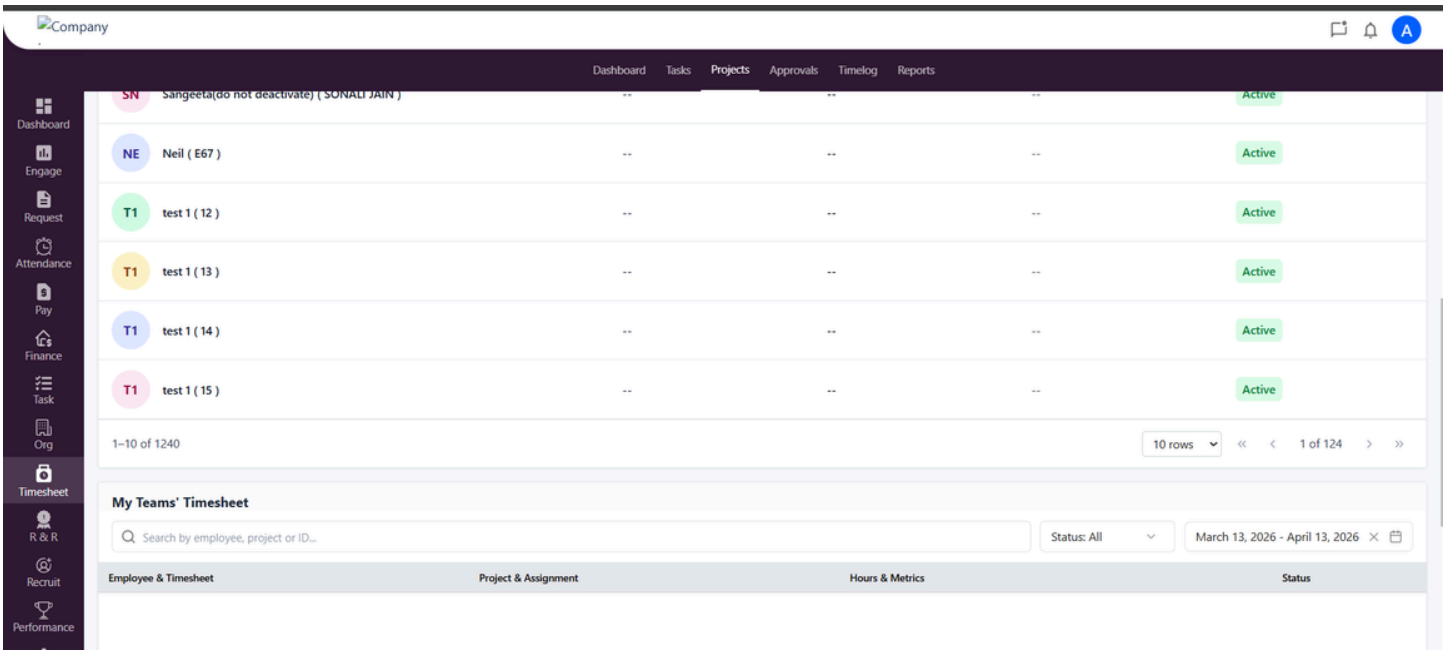
- Names and profiles of all team members tagged to this project
- Each team member may be assigned to the same task or different tasks under the same project

Timesheet Visibility for Team Members:

- The logged-in employee can view a **summary of their co-team members' timesheets** for the project
- This is a **read-only view** — the employee cannot edit, approve, reject, or take any action on a co-member's timesheet
- The view shows a **summary level** — for example, hours logged per day or total hours logged by the team member on that project

Access Rule:

- Visibility is limited to team members who are part of the **same project**
- Employees cannot see timesheets of people outside their project



Example:

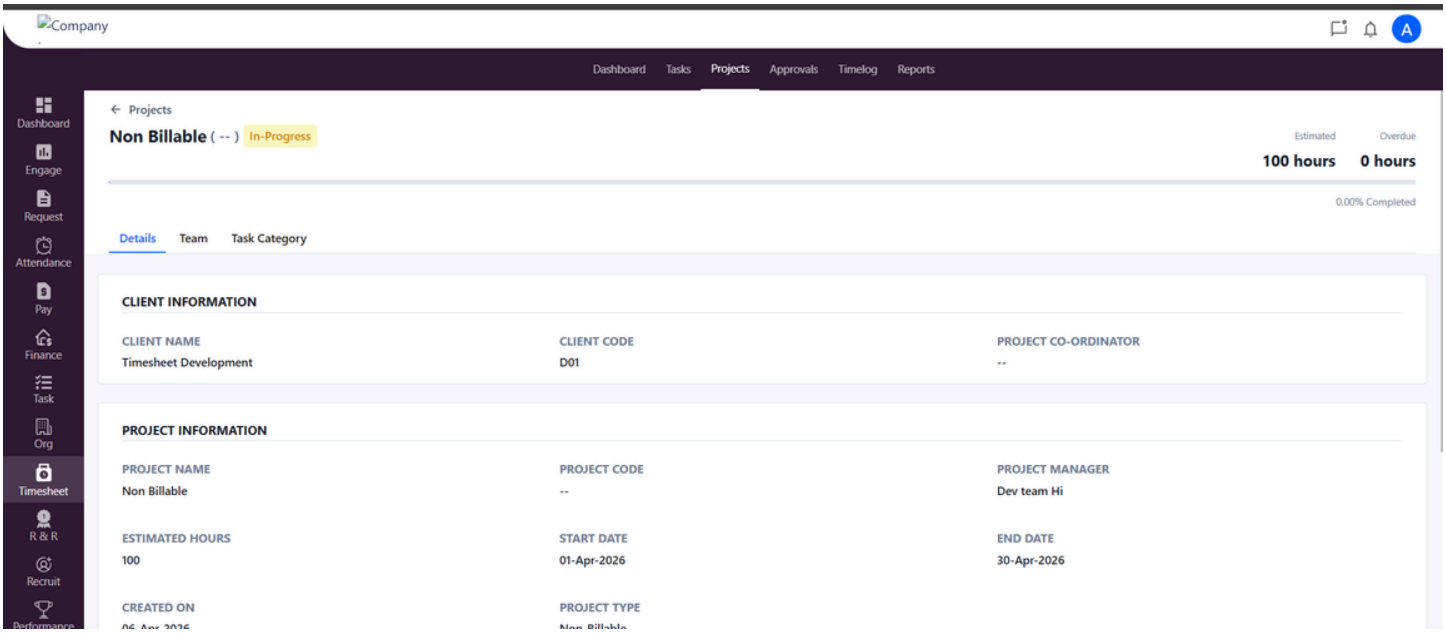
Project P1 has two members — Employee A and Employee B — assigned to different tasks within P1. When Employee A opens the Team tab, they can see Employee B's timesheet summary for P1 — and vice versa. Neither can modify or take any action on the other's timesheet.

Tab 3 – Task Category

Displays the task categories defined under the project.

(Detailed scope to be confirmed — placeholder for task category configuration visible at project level.)

In Scope	Out of Scope
UI refresh of Project sub-menu	Backend logic changes
Project list view (assigned projects only)	Admin-side project configuration
Three-tab structure: Details, Team, Task Category	Timesheet approval workflows
Read-only team timesheet summary view	Any action on co-member timesheets



ESS Timesheet Module – Approval Sub-Menu Enhancement:

1. Overview

In the **Approval Menu**, the following three options are available:

- My Timesheet
- Team Timesheet
- Pending on Me

2. My Timesheet

- Users can view their own submitted timesheets.
- On clicking any timesheet, a **detailed screen** opens with task-level entries.
- Each task can be expanded to view **time logs recorded against that task**.

3. Team Timesheet

- Reporting Managers (RMs) can review their **team members' timesheets**.
- The functionality and navigation flow are the same as in *My Timesheet*.

4. Pending on Me

- Displays timesheets pending for approval where the logged-in user is an **approver for any project**.
- Approvers can review and take action (approve/reject) on task-level entries.
- The detailed view and task-level log visibility follow the same structure as other menus.

5. Approval Workflow Logic

Example Scenario:

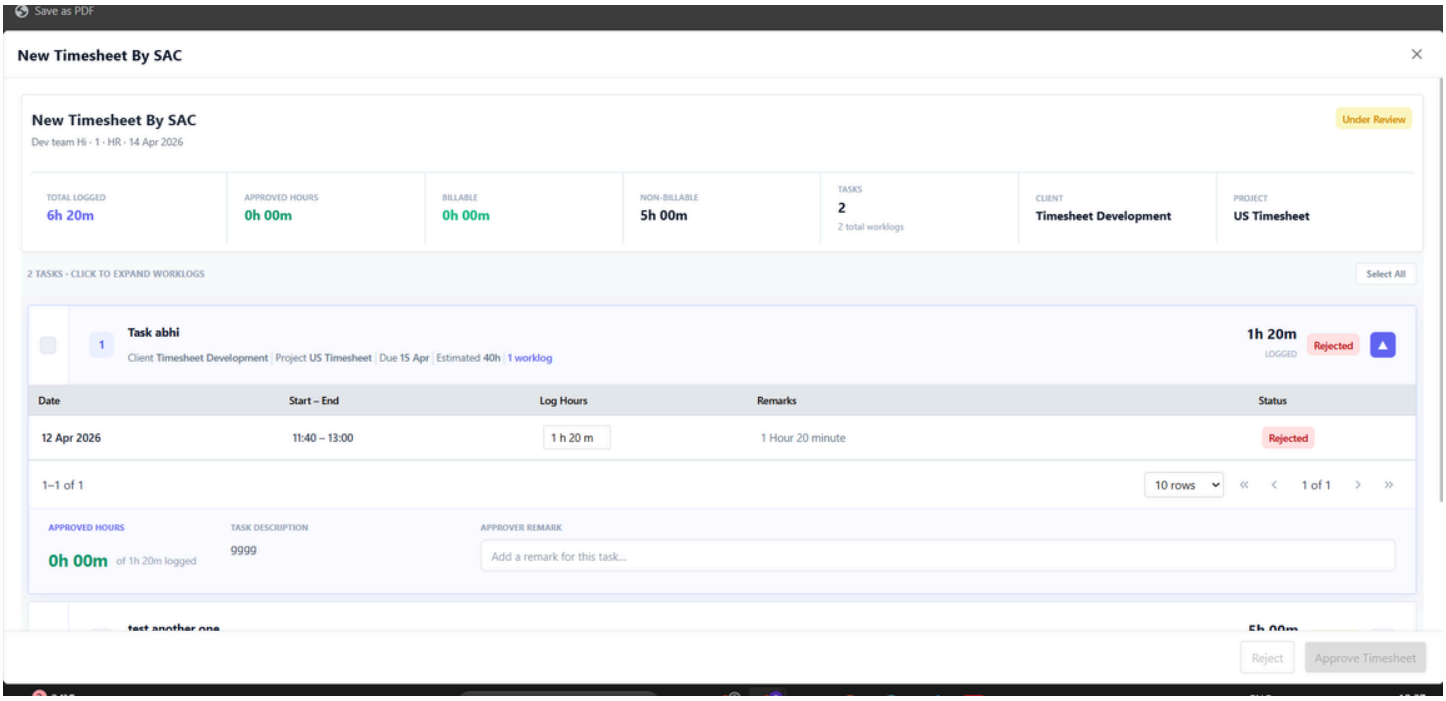
- A user submits a timesheet with **3 tasks**, each containing **multiple time logs**.

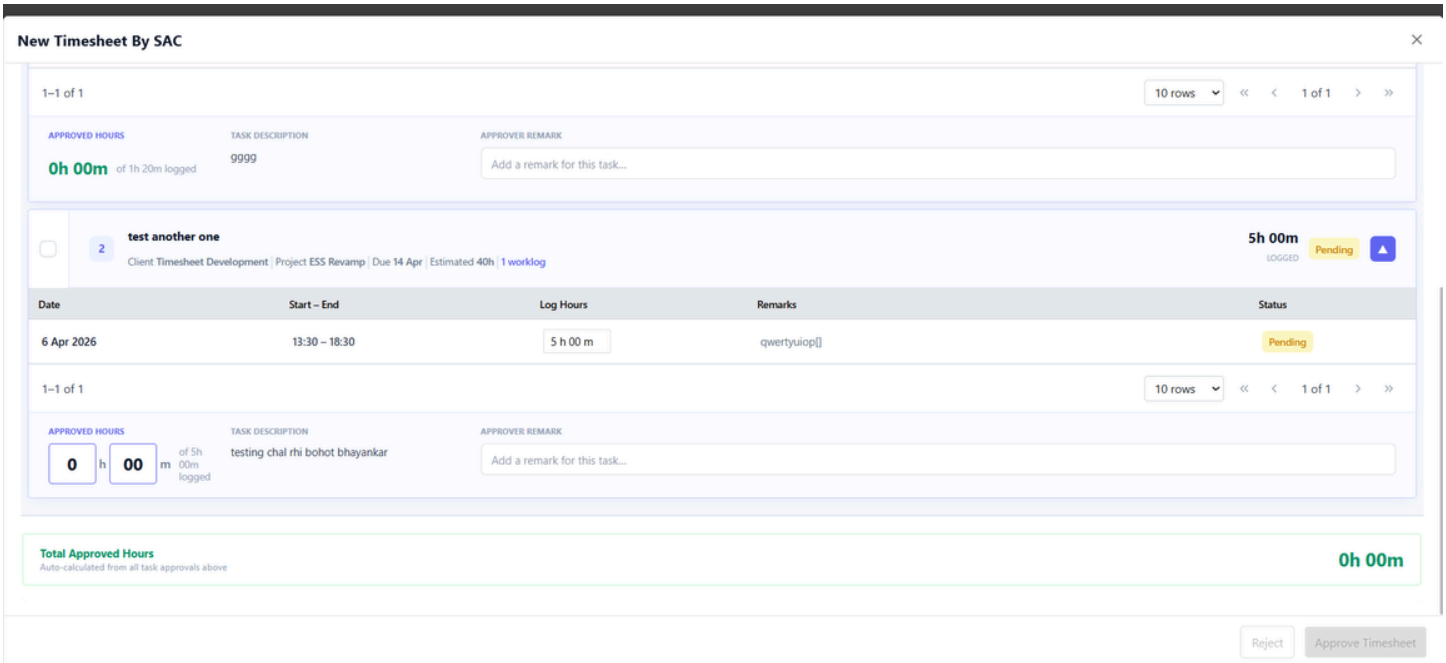
Approval behavior:

- If the approver **partially reviews (e.g., approves only one task)** and takes no action on remaining tasks:
  → Status = **Under Review**
- If **all tasks are approved**:
  → Status = **Reviewed**
- If **some tasks are approved and at least one task is rejected**:
  → Status = **Reviewed**
- If **all tasks are rejected**:
  → Status = **Rejected**

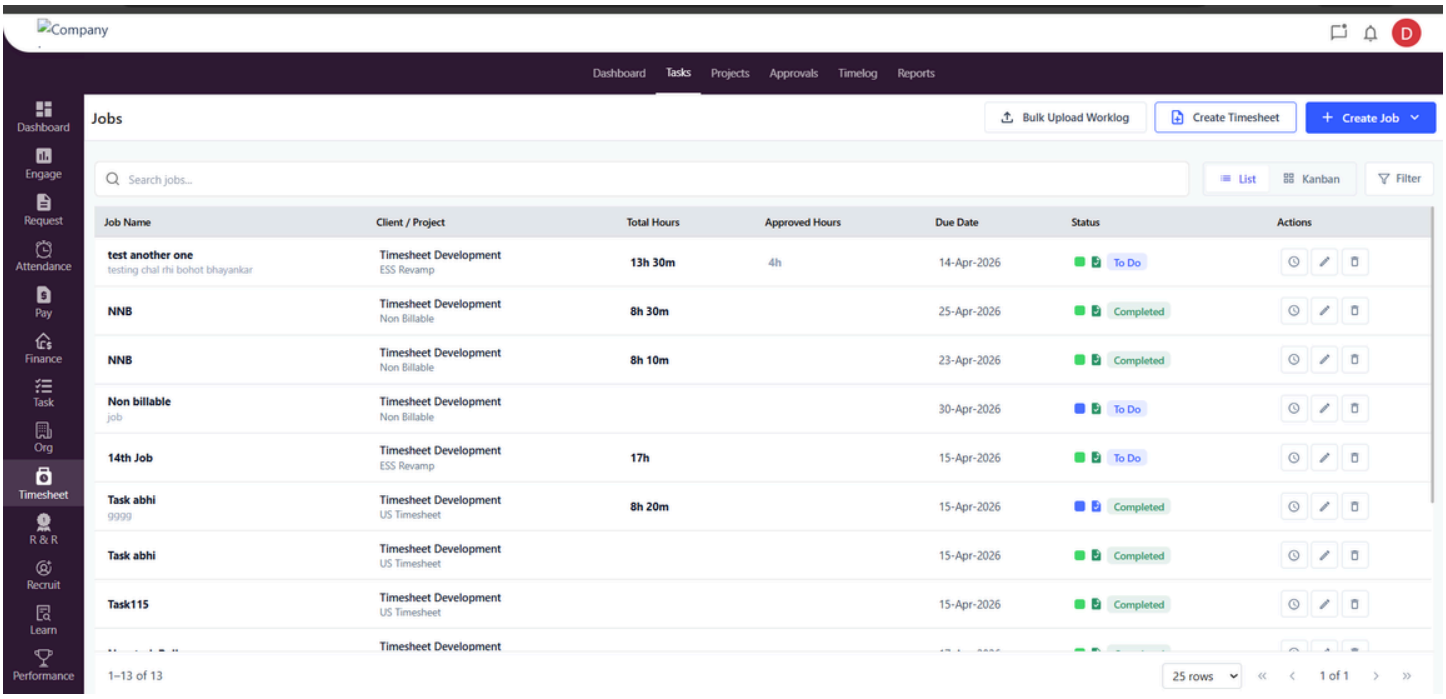
6. Key Notes

- Rejected tasks → removed from submitted timesheet and go back to the not submitted stage
- Rejected logs → moved back to editable (not submitted) stage
- Users → can correct and resubmit rejected entries





ESS Timesheet Module – Jobs Sub-Menu Enhancement:



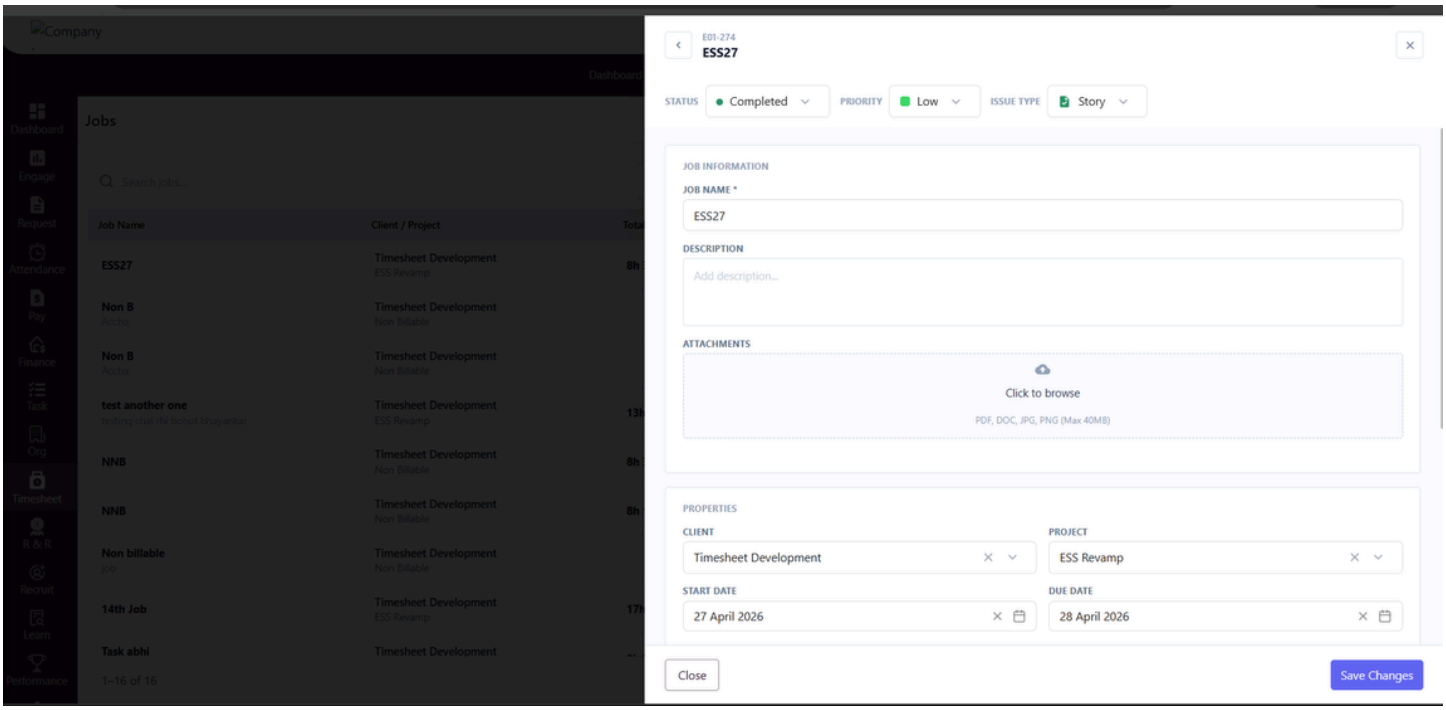
Jobs Screen – Functionality Overview & Enhancements

1. Jobs Listing Screen

- Users can view all jobs in the Jobs screen.
- Each job displays:
  - Job Name
  - Client / Project
  - Total Hours
  - Approved Hours
  - Due Date
  - Status

2. Job Details & Worklogs

- Users can click on any Job Name to view full details.
- Each job contains associated worklogs.
- Users can:
  - View all worklogs under a job
  - Add new worklogs by:
    - Clicking on the Job Name, or
    - Clicking on the Clock icon in the job list



3. Available Actions

The following options are available on the Jobs screen:

1. **Create Timesheet**
2. **Bulk Upload Worklog**
3. **Create Task**

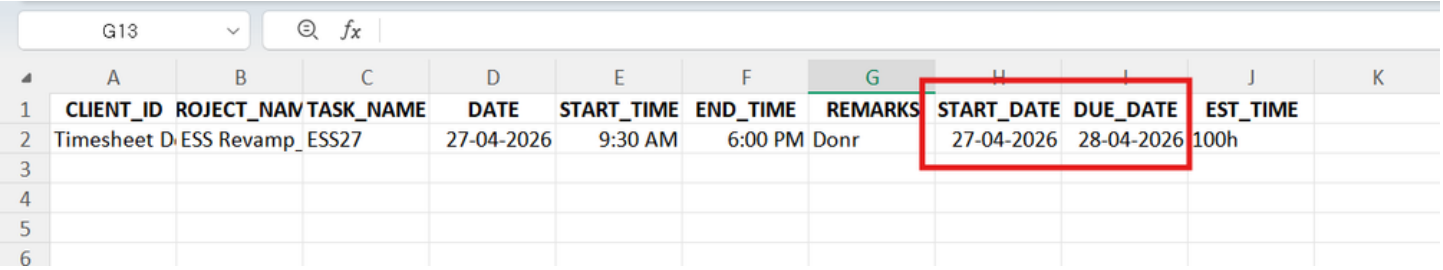
4. Bulk Upload Worklog

- Users can upload worklogs using an Excel sheet.
- Existing functionality remains unchanged.

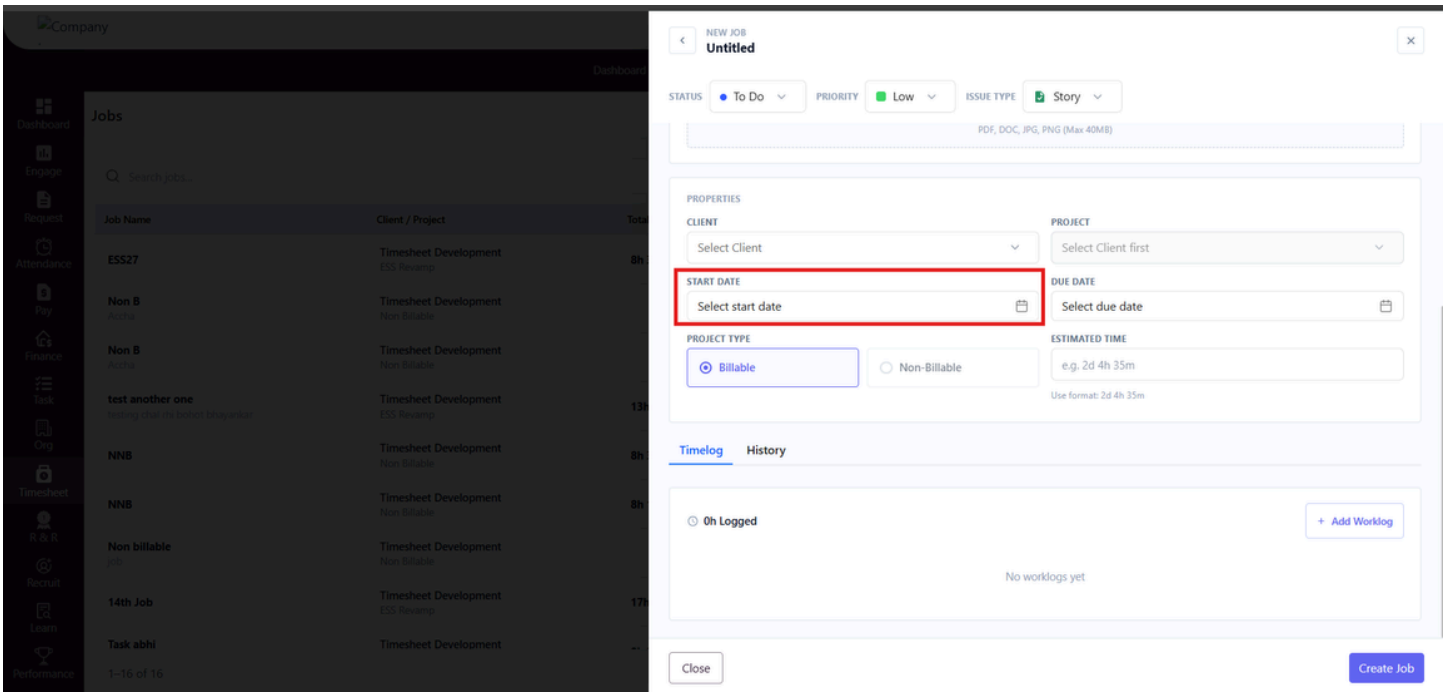
Enhancement:

    - Enhancement: Start Date in Bulk Upload & Task Creation
- A new field **"Start Date"** has been introduced in both:
  - Bulk Upload Worklog sheet
  - Manual Task Creation process
    - Field Clarification
- **Start Date & Due Date** → Represent the **task duration**
- **Date (in worklog sheet)** → Represents the **actual worklog entry date**
- **Start Time & End Time** → Represent the **hours logged for that specific date**
    - Key Capability
- With this enhancement, users can now perform **both actions in a single bulk upload sheet**:
- **Create a new task** (using Start Date & Due Date)
- **Log work against that task** (using Date, Start Time, End Time)
    - Benefit
  - Eliminates the need to create tasks separately before logging work
- Ensures proper **task scheduling (Start → Due Date)**

- Enables accurate **calendar visibility**
- Improves efficiency by allowing **task creation + worklog entry in one step**



CLIENT_ID	ROJECT_NAM	TASK_NAME	DATE	START_TIME	END_TIME	REMARKS	START_DATE	DUE_DATE	EST_TIME
Timesheet D	ESS Revamp_	ESS27	27-04-2026	9:30 AM	6:00 PM	Donr	27-04-2026	28-04-2026	100h



Reason:

- Previously, only Due Date was captured.
- Due to the absence of Start Date:
  - Tasks were not visible in the calendar view (Timelog screen).
- With Start Date:
  - The system can now determine the task duration (Start → Due Date).
  - Tasks will be correctly displayed in calendars.

5. Create Task

- Users can create new tasks.
- Start Date field is now mandatory/available here as well.

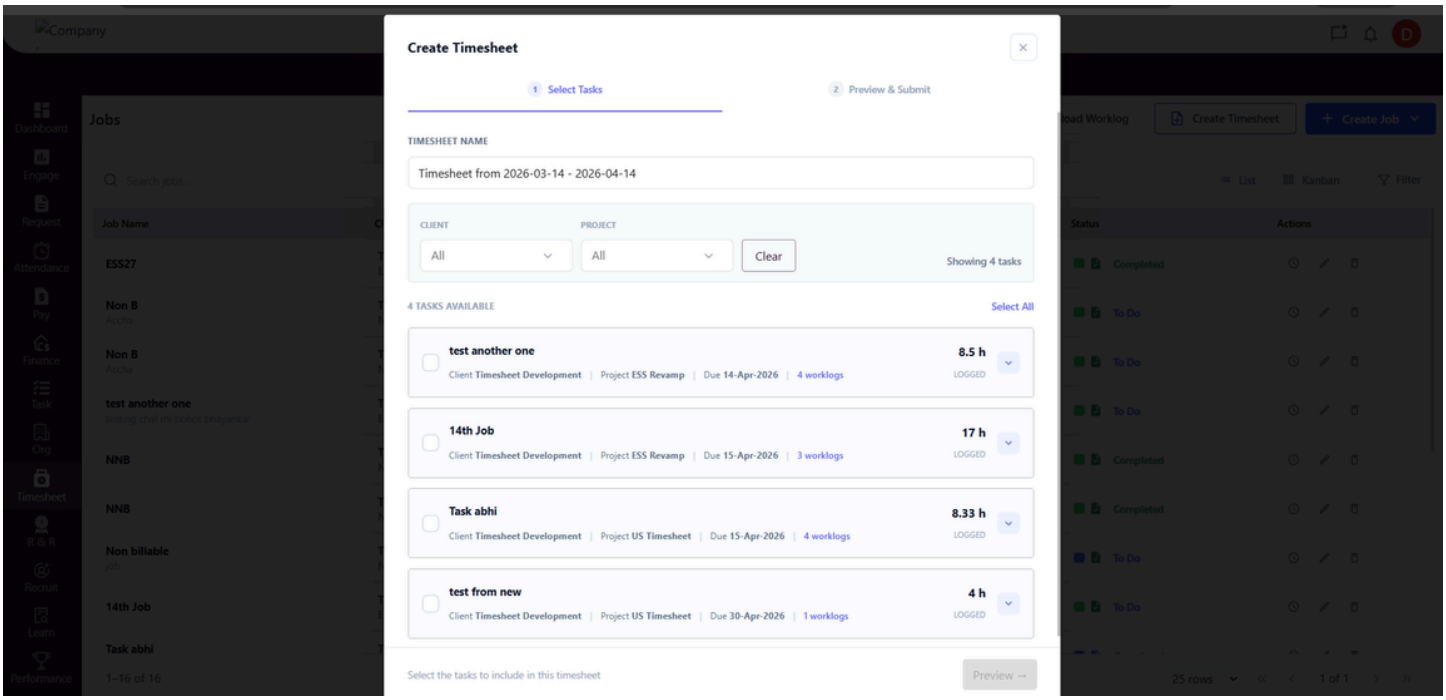
6. Create Timesheet (New Enhancement)

Previous Behavior:

- All tasks were displayed in a list.
- No clear visibility of which worklogs were already submitted or pending.

Current Behavior (Enhanced):

- On clicking Create Timesheet:
  - A new screen opens.
  - Only tasks/worklogs that are NOT yet submitted in any timesheet are displayed.



7. Worklog Selection & Submission

- Users can:
  - Select entire tasks, or
  - Select specific worklogs within a task
- **Users can create a timesheet based on:**
  - Selected tasks
  - Selected worklogs
- **After selection:**
  - Timesheet can be submitted for approval.

8. Key Improvement

- **Worklogs are now:**
  - Grouped under Jobs
  - Clearly structured and easier to track
- **This resolves the earlier issue where:**
  - Tasks/worklogs were shown without clarity of submission status.

9. Summary of Changes

- Introduced Start Date (Bulk Upload + Task Creation)
- Improved Timesheet Creation Flow
- Filtered only unsubmitted worklogs
- Enhanced data visibility and usability
- Improved calendar integration for tasks
